

PHYSIQUE 57 INDIA

IRIS

The studio support workspace.

A complete guide to raising tickets, tracking resolutions, reviewing classes and keeping every studio running beautifully — written for the people who use IRIS every day.

USER GUIDE

EDITION 1.1 · EXPANDED

SEPTEMBER 2026

- **Guided intake**

Every ticket starts from the right questions — filed in minutes.

- **Automatic routing**

Category and priority send it to the right team, every time.

- **Live visibility**

Radar, dashboards and reports keep nothing out of sight.

SERVING EVERY STUDIO

Kwality House · Kemps Corner Supreme HQ · Bandra Kenkere House · Bengaluru Courtside · Mumbai Copper & Cloves · Bengaluru

Internal training material · Please do not redistribute outside the Physique 57 India team.

One workspace for everything support.

IRIS is the Physique 57 India support hub: every member concern, studio issue, class note and trainer review lives here as a ticket — filed in minutes, routed to the right team automatically, and tracked until it is genuinely resolved.

File it fast

Guided forms ask only what the ticket actually needs — most take under two minutes.

Routed for you

Category and priority decide the owning department and response target. No guesswork.

Nothing slips

Statuses, deadlines and dashboards keep every open item visible until it is closed.

What's inside

01	Getting started	Signing in, roles, your profile and the top bar	02
02	The workspace at a glance	Every section of the app and what it is for	03
03	Raising a ticket	The guided intake flow, step by step	04
04	Intake power tools	Class desk, linking, write-up and shortcuts	05

06	Categories & routing	Where each kind of ticket goes, and why	07
07	The ticket lifecycle	Statuses, priorities and response targets	08
08	Views & queues	Five views, two queues, filters and saved views	09
09	Everyday ticket actions	Inside a ticket: tabs, edits, relations, exports	10
10	Ownership & resolutions	Assignment, private resolutions and edits	11
11	Templates, forms & trainer reviews	Structured feedback, drafts and assessments	12
12	Dashboards, radar & reports	Seeing the bigger picture	13
13	The equipment register	Fleet, statuses, snag history and photos	14
14	The Momence workspace	Members, sessions and rosters inside IRIS	15
15	Best practices	Habits that make tickets genuinely useful	16
16	FAQ & troubleshooting	Twelve quick answers to common questions	17
17	Glossary	The words IRIS uses, in plain language	19

Getting started

Access is managed by your workspace administrators — there is nothing to install. You sign in with your work Google account or your work email, in any modern browser, on desktop or mobile.

Signing in — four quick steps

Two roles, one workspace

Know your top bar

Your profile

Open the account menu → Profile to check your linked staff record, department and home studio, and to switch themes. If anything looks wrong — the wrong studio, the wrong team — ask an administrator to correct it in People & teams; you cannot edit those fields yourself.

TIP

Locked items in the left navigation (with a small lock) are administrator areas. Everything else is yours to use — and the rail collapses to icons when you want more room.

The workspace at a glance

Everything lives in the left navigation rail. Collapse it any time — icons keep their tooltips — and press the search in the top bar to jump straight to any section.

Overview

Your daily start point: live counts, response-time pulse and the day's priorities.

IRIS assistant

Raise a new ticket through the guided intake flow — the heart of the app.

Radar

A live operations radar per studio: what is open, ageing or breaching right now.

All tickets

Every ticket in five views, with filters, saved views, queues and exports.

Equipment

The equipment register: machines, statuses, snag history and photos across studios.

Template library

Guided templates that start a ticket with the right questions already asked.

Reports library

Ready-made report types over live data, exportable in seven formats.

Trend dashboard

Analytics over time: volumes, categories, studios and conversation themes.

Trainer reviews

ADMIN

Consolidated trainer performance reports from reviews and assessments.

Evaluation forms

Embedded evaluation and feedback forms, filled in where the work happens.

Momence

Your studio platform data — members, sessions, rosters — viewed inside IRIS.

People & teams

ADMIN

Accounts, roles, departments and studios for the whole workspace.

Integrations

ADMIN

Connections to email, automation and studio tools, with delivery logs.

Settings

ADMIN

Workspace configuration: taxonomy, response targets, templates and history.

Raising a ticket

Open IRIS assistant in the navigation. The intake is a short, guided form: it asks only the questions your chosen sub-category needs, reads the ticket back to you, and files it — routed, prioritised and time-stamped automatically.

1

Pick a category

Start with what the ticket is about — Scheduling, Class Experience, Repair & Maintenance, Pricing & Memberships and more. Each category shows only its own sub-categories.

2

Pick a sub-category

The sub-category decides the exact questions on the form, the owning department, and the ticket's default priority. Choose the closest match — you can say more in the description.

3

Answer the questions

Required fields are marked; conditional questions appear only when an earlier answer makes them relevant. Filing about a member or a class? Link the real record instead of typing a name.

4

Review the draft

IRIS reads the ticket back: summary, details, routing, priority and response target. Fix anything before it is filed — nothing goes in until you confirm.

5

File it

One tap files the ticket. It appears instantly in All tickets with its reference, status and owner — and the assigned team is notified where the workspace has that switched on.

GOOD TO KNOW

Filing the same thing twice by accident is handled for you — identical submissions are de-duplicated, so a double-tap never creates two tickets. And a paused intake is never lost: save it as a private draft and pick it up later, exactly where you left off.

Intake power tools

Four features turn a good ticket into a great one. They are all on the same intake screen — learn them once and every ticket gets faster and more accurate.

Start from a class

Something happened in a session? Tap “Start from a class” and pick the session. IRIS pulls the format, coach, start time, roll call and capacity straight from Mومence and builds the ticket around the class — nothing typed, nothing misspelt.

Best for: class experience, instructor punctuality, hosted classes, anything session-specific.

Link, don't type

When a ticket concerns a member or a class, the form asks you to link the actual record via search. Linked records carry their real details with them, so the owning team never has to guess who or which session you meant.

Best for: every member-related ticket. A typed name is accepted only when you're not signed in, and it is labelled as typed.

Required only

In a hurry at the front desk? Flip the “Required only” switch and the form hides every optional question, leaving just the fields the ticket cannot file without. Flip it back any time to add richer detail.

Best for: busy hours. File the essentials now; edit the ticket with more detail later.

Write it up from the answers

One tap composes a clean summary paragraph from the answers already on the form. It is completely deterministic — it phrases what you answered and never invents anything you didn't say.

Best for: consistent, readable summaries without writer's block. Review it, tweak it, file it.

Speak instead of type

The microphone on the intake screen supports dictation — describe the issue out loud and watch it land in the field — plus simple voice commands like “review draft” and “approve ticket”. Availability depends on your browser; the mic greys out where speech input isn't supported.

Shortcuts worth bookmarking

`/iris`

Opens the guided intake, ready to file.

`/iris?desk=class`

Opens the class desk directly — pick a session and go.

`/iris?category=...&subcategory=...`

Deep-links straight into a specific form.

Legacy chat switch

Prefer a conversation? The previous chat-style intake is one switch away.

Anatomy of a ticket

When you file, IRIS does far more than store your answers — it writes a complete work order. Here is every part of a filed ticket and what it is for.

Ticket number

A unique reference, like a receipt. Quote it in any follow-up, handover or vendor call.

Title & summary

The one-line story plus the full detail you filed — what a reader sees first.

Category & sub-category

What the ticket is about. This pair drives routing, priority and the form itself.

Studio

Where it happened. Keeps multi-studio queues clean and reports honest.

Department & owner

The owning team and the one person currently accountable for the fix.

Priority & severity

How urgent it is — critical, high, medium or low — with its severity note.

Response target

The first-response deadline, stamped at creation from the priority.

Tags

Quick labels applied automatically — filters and reports use them heavily.

Ops checklist

Concrete next steps generated for the owning team, so work starts immediately.

Member-facing update

Ready-to-send wording for replying to the member — polite, accurate, on-brand.

Internal brief

Context written for the team, not the member: background, risk, watch-outs.

Routing reason

Why the ticket went where it went, in plain words — no black box.

Linked records

The member, class or equipment asset attached to the ticket, with live details.

Version & audit trail

Every change, by whom, when — plus the revision number that protects edits.

ATTACHMENTS

Tickets take attachments: photos (JPEG, PNG, WebP, GIF), PDFs, Word and Excel files, up to 10 MB each. A photo of the fault is worth a paragraph — attach it.

NO BLACK BOX

Everything above is visible on the ticket. If a priority or route ever looks wrong, the routing reason tells you exactly why it was chosen — and an edit fixes it.

Categories & routing

Every ticket is routed by its category — deterministically, the same way every time. Pick the right category and the right team sees it within its response target. Here is the full map.

TRAINING

Scheduling

Class Experience

Trainer Feedback

OPERATIONS

Repair and Maintenance

Studio Amenities and Facilities

Operating Systems

Tech Issues

Theft and Lost Items

Internal Operations & Admin

Miscellaneous

ACCOUNTS

Pricing and Memberships

SALES & CLIENT SERVICING

Customer Service and Communication

MARKETING

Brand Feedback

MANAGEMENT

Safety and Security

PROCESS NOTE

Not sure between two categories? Pick the one that names the outcome the member cares about — a broken shower is Studio Amenities, not Miscellaneous. Miscellaneous is a last resort, and admins review its use.

The ticket lifecycle

A ticket moves through a clear pipeline from filed to closed. Statuses are how everyone — front desk, owning team, management — knows exactly where things stand.

The status pipeline

Waiting statuses pause the clock story: they say the ball is with the member or an outside vendor. Resolved means the work is done and written up; Closed means it has been verified and archived.

RECORDED

Compliments, qualifying positive feedback and assessments can be record-only: they are filed as “Recorded” with no deadline and no required resolution. Praise counts — it just doesn't need chasing.

Priorities & first-response targets

Every ticket carries a priority, and every priority has a first-response target. These are the workspace defaults — administrators can tune them in Settings.

Critical

Safety, security, anything stopping a class

12 h

High

A member is blocked or a studio system is down

16 h

Medium

Standard issues and requests — the default

48 h

Low

Nice-to-fix items, suggestions, minor niggles

72 h

IMPORTANT

Priority is set by the category and your answers — escalate honestly. Marking everything critical slows down the tickets that truly are. Genuinely urgent tickets can also be flagged as escalated, which lifts them to management attention.

● Clock starts

The moment a ticket is filed, its first-response target is stamped on it.

● Countdown visible

Lists and boards show time-to-target on every ticket, at a glance.

● Breach surfaces

Anything overdue is marked breached and rises to Radar and Overview.

Views & queues

All tickets is your control room. Five views over the same live data, two queues, deep filters and saved views mean the board always looks the way your role needs it to.

Five ways to see the same queue

List view

A dense, sortable table — best for triage, bulk scanning and export. Status, owner, priority and time-to-target in every row.

Board view

A kanban board grouped by status — or the grouping you choose. Drag the day forward; ideal for a team around one screen.

Cards view

Rich cards with summaries and badges — the most readable way to review a shortlist or walk a manager through the week.

Matrix view

A category × status grid of counts. Click any cell and IRIS opens exactly those tickets as a filtered list — the fastest drill-down in the app.

Feed view

A chronological stream, newest first — the “what just happened” view for catching up after a day off.

Two queues: everything, or just yours

The tabs above the board switch between All tickets — the whole workspace — and Assigned to me, your personal queue. “Assigned to me” needs your account linked to a staff profile; if it looks empty when it shouldn't, that link is the first thing to check.

Filters & saved views

Stack filters for status, priority, category, studio, department, owner, source and date range — the active-filter summary stays visible even when the panel is collapsed, so a filtered board never looks like an empty one. Save any combination as a saved view: your layout, columns, filters and views are stored with your account in the workspace, so they follow you to any device.

EXPORT

The export button downloads exactly what is on screen — current filters, current tab — as a spreadsheet-ready file. Filter first, then export; you get precisely the slice you were looking at.

TIP

The board refreshes itself — on a timer, when tickets change and when you return to the tab. No need to hammer refresh during a busy shift.

Everyday ticket actions

Open any ticket and everything about it is on one screen, in three tabs — with safe editing, duplication and relations one click away.

Inside a ticket: three tabs

Overview

The full work order: summary, answers, routing, priority, response target, linked member or class, ops checklist, member-facing update and internal brief.

Activity

Comments from the team plus the audit trail — every status change, edit and assignment, by whom and when. Add a comment whenever you learn something new.

Related

Tickets linked to this one, plus suggestions from the same category and sub-category — spot the pattern before the third studio reports it.

Actions you'll use daily

• Update status

Move the ticket along the pipeline as work happens, not at week's end — the record keeps who changed what, and when.

• Edit safely

Edits use revision checks: if a colleague saved changes while you were typing, IRIS asks you to reload rather than silently overwriting them.

• Comment

Anything worth telling the next person goes in a comment — it is timestamped, attributed and permanent.

• Duplicate

Same issue, different day or studio? Duplicate a ticket and adjust — faster and more consistent than retyping.

• Relate tickets

Link tickets that belong together. IRIS also suggests likely matches automatically.

• Export CSV

Any filtered view exports to CSV for spreadsheets, audits or vendor follow-ups.

SLA COUNTDOWN

Every open ticket shows a live countdown to its response target. When the target passes, the ticket is flagged breached — it rises on the Radar and Overview until someone deals with it.

ESCALATED

A ticket can be marked escalated when it needs management attention beyond its priority. Escalation is a spotlight, not a queue-jump — use it for genuine risk, not impatience.

Ownership & resolutions

Every ticket has exactly one accountable owner at a time. Ownership is what turns a filed ticket into a fixed problem.

How assignment works

Private resolutions

Resolutions can contain sensitive detail — a member's circumstances, a vendor negotiation, a staff conversation. So resolution notes are private by design: only the current assigned owner, signed in with their own account, can read or write the private resolution. Not colleagues, and not administrators — there is no blanket override. If ownership changes, access moves with it.

Writing a good resolution

- ✓ Say what was actually done, not just “fixed”
- ✓ Note who was spoken to and what was agreed
- ✓ Record anything the next owner would need
- ✓ Resolve first, then close once verified

What everyone else sees

- ✓ Status, owner, priority and timestamps
- ✓ The public summary and ticket details
- ✓ The activity and audit trail
- ✓ Never the private resolution text

Edits, history & the audit trail

Everything meaningful is recorded: creation, status changes, edits, assignment changes, and relations. Edits are protected by revision checks so two people can't silently overwrite each other. If your save is rejected, reload the ticket, review the newer changes, and re-apply yours — thirty seconds that prevents lost work.

PROCESS NOTE

Going on leave? Ask an administrator to reassign your open tickets — resolution access follows the owner, so handovers should be explicit, not assumed.

Templates, forms & trainer reviews

Structured feedback beats free text. IRIS ships guided templates, embedded evaluation forms and consolidated trainer reports so quality work is captured the same way every time.

Template library

Guided templates open a structured form with the right questions already asked — category-specific fields, hosted-class feedback, weighted trainer assessments and more. Start from a template whenever one fits: it is faster than a blank form and far more consistent.

Drafts: pause any intake and save it privately — you get three draft slots, visible only to your account.

Evaluation forms

The Evaluation forms section embeds the team's live evaluation and feedback forms right inside IRIS, so audits and reviews are filled in where the work happens. Administrators can add new forms to the shelf at any time.

Submissions flow back into the workspace automatically — no copying results across.

Trainer reviews

Reviews and weighted assessments consolidate into one performance report per trainer: rubric scores, trends and written feedback in a single view for the training team.

An administrator area — scores and commentary are handled with care.

Hosted classes & rubrics

Purpose-built workflows cover hosted classes, instructor punctuality, late arrivals, class experience and studio environment, each with its own assessment rubric where scoring applies.

Missing rubric answers are rejected rather than silently scored as zero — complete the form fully.

When to use which

A member complaint at the desk

➤ IRIS assistant — guided intake, linked member

Feedback about a specific session

➤ IRIS assistant — “Start from a class”

A recurring structured check

➤ Template library — pick the matching template

A scheduled audit or evaluation

➤ Evaluation forms — fill the embedded form

Reviewing a trainer's quarter

➤ Trainer reviews — open the consolidated report

Dashboards, radar & reports

Filing tickets is half the story — seeing the pattern is the other half. Four views cover the next minute, the day, the month and the deep dive.

YOUR MORNING

Overview

The landing dashboard: live open counts, response-time pulse and the day's priorities in flip-card metrics. Click a metric card to flip it and see the top studios behind the number. Start here every shift — it answers “what needs me today?” in ten seconds.

RIGHT NOW

Studio ops radar

A live radar per studio showing what is open, what is ageing and what is at risk of breaching its response target. Switch studios at the top. If you run a floor, keep Radar open — it is designed to be glanceable from across the room.

THE RECORD

Reports library

Ready-made report types over live data — breakdowns by status, priority, studio, category, department and source — exportable in seven formats: CSV, Excel, JSON, PDF, Word, Markdown and HTML. Filter, pick a format, done: the management pack builds itself.

THE PATTERN

Trend dashboard

Analytics over time: volumes, categories, studio-by-studio comparisons and the conversation themes that matter. Use it monthly to spot what keeps recurring — the ticket you prevent is the cheapest ticket of all.

A weekly rhythm that works

DAILY

Overview at shift start; Radar on the floor; clear anything breaching today.

WEEKLY

All tickets filtered to your team; chase waiting states; close verified work.

MONTHLY

Trend dashboard for patterns; Reports library for the management pack.

TIP

Every dashboard reads the same live data as All tickets — if a number looks wrong, click through to the underlying tickets rather than second-guessing the chart. The answer is always one level down.

The equipment register

The register tracks the physical fleet — bikes, machines and studio hardware — with per-item status, photos, warranty dates and a permanent snag history across every studio.

How the register is organised

Two tabs: Items — every individual asset — and Types, the catalogue of equipment kinds. The register opens as a table because a register is something you scan and compare; switch to cards when you want photos and detail. Each item carries its studio, category, warranty and acquisition dates, notes, a photo, and a running count of snags logged against it.

Four statuses, one truth

In service

On the floor and usable — the default healthy state.

In repair

A fix is underway; the item is expected back.

Out of rotation

Pulled from use — waiting on parts, a decision or a vendor.

Retired

Permanently withdrawn. Retired, never deleted — its snag history survives.

Working with the register

Log precisely

Name the machine and the part — “bike 7, left pedal” beats “a bike is broken”. Repair tickets can link the exact asset.

Check history first

Open the item before calling the vendor: the same fault twice in a month is a different conversation.

Close the loop

When the repair is done, resolve the ticket and update the status so the register reflects reality.

DID YOU KNOW

The register knows the PowerCycle bikes down to individual parts — console, power meter, pedals, levers, flywheel — so a repair ticket that names the exact part arrives with the right tools and settings already understood.

LIVE STATUS

Status changes appear for everyone without a refresh — that is the whole point of the register. If a bike goes out of rotation mid-morning, the afternoon shift already knows.

The Momence workspace

Momence is the studio platform behind memberships, sessions and rosters. Inside IRIS you can browse it read-first, without leaving the app or re-typing anything — and the intake flow uses the same connection when you link a member or start a ticket from a class.

One module at a time

Pick a module — Members, Sessions, Memberships, Studios and more — and IRIS shows just that module, as cards or a table. Open any record for the full picture:

Members

Contact details, first and last seen, total visits, memberships, bookings and notes — with quick links to every session they touched.

Sessions

Instructor, studio, start time (IST), duration, bookings against capacity — plus the full roster: sign-ups, cancellations and check-ins, page by page.

Memberships & studios

Plans, validity and studio records — the reference data behind every lookup, one click from any member or session.

Trust, clearly labelled

What you can rely on

- ✓ Live records exactly as Momence returns them
- ✓ Rosters, capacity, check-ins and visit history
- ✓ Every record labelled: Live, Workspace directory or Demo
- ✓ Errors and empty results shown honestly, never papered over

What to watch for

- ✓ Demo records appear only when no live connection is configured
- ✓ Demo data is never mixed into live results
- ✓ Changes to Momence data are admin-only and always confirmed first
- ✓ Roster counts refer to the loaded page — page through long rosters

FRONT DESK MOVES

Signed-in staff can act on a live session from the roster where their role allows it — check a member in, undo a check-in, add a complimentary booking or a waitlist entry. Every write asks for confirmation first, and larger changes are administrator-only.

PRIVACY NOTE

Member records are personal data. Look up only what the ticket needs, keep sensitive detail in the private resolution, and never export member data outside approved workflows.

Best practices

The difference between a ticket system that works and one that gets ignored is habits. These are the ones that matter.

DO

- ✓ File it while it's fresh — same shift, same hour if you can
- ✓ Link the real member and the real class, every time
- ✓ One issue per ticket; relate tickets that belong together
- ✓ Write summaries a stranger could act on tomorrow
- ✓ Attach a photo of the fault — it beats a paragraph
- ✓ Update status as work happens, not at the end of the week
- ✓ Resolve with substance — what was done, agreed and verified
- ✓ Check the radar before promising a member a timeline

AVOID

- ✗ Don't type a member's name when you can link the record
- ✗ Don't bundle three problems into one “studio issues” ticket
- ✗ Don't mark routine requests critical to jump the queue
- ✗ Don't leave tickets in “In progress” as a parking lot
- ✗ Don't put sensitive member detail in the public summary
- ✗ Don't close a ticket the member doesn't agree is fixed
- ✗ Don't default to Miscellaneous — a real category routes better
- ✗ Don't rely on WhatsApp memory — if it matters, it's a ticket

The golden thread

Every good ticket answers three questions: What exactly happened? Who and what does it involve — linked, not typed? What does “fixed” look like? If your ticket answers all three, the owning team can act without coming back to you, and the member gets their answer a day sooner.

1 · WHAT HAPPENED?

2 · WHO & WHAT — LINKED?

3 · WHAT DOES FIXED LOOK LIKE?

If it matters, it's a ticket.

The one habit that makes everything else in this guide work.

FAQ & troubleshooting

Quick answers to the questions the team actually asks.

Q I can't sign in — what do I check first?

Use your work account. If you signed up with email, confirm the link sent to your inbox first. Still stuck? An administrator can check your account status in People & teams — accounts can be deactivated, which ends access immediately.

Q I filed a ticket with a mistake in it. Now what?

Open it from All tickets and edit — the revision history keeps the original. If it was the wrong sub-category entirely, edit the ticket or duplicate it into the right form and relate the two.

Q Why can't I see the resolution on a ticket?

Resolutions are private to the current assigned owner — by design, with no admin override. If you now own the ticket, access is yours; if you need the content of an older resolution, ask the previous owner.

Q The member I'm filing about isn't found in search.

Check spelling and try phone or email fragments. If they're genuinely not in Momenca yet, file with what you have and note it — but linked records should be the norm, not the exception.

Q My save was rejected — “the ticket changed”.

A colleague saved changes while you were editing. Reload the ticket, review the newer version, and re-apply your edit. Nothing you can do corrupts the record — the check exists to protect both of you.

Q A record says “Demo” on it. Is that real?

No — Demo-labelled records appear only when no live studio connection is configured, and they are never mixed into live results. If you see Demo where you expect live data, tell an administrator.

FAQ & troubleshooting • continued

More answers — views, attachments, voice, queues and flags.

Q Does marking a ticket Resolved close it?

Not quite. Resolved means the work is done and written up. Closed means it has been verified. Resolve when you finish; close when you (or the process) have confirmed the fix stuck.

Q Can I get my filtered ticket list into a spreadsheet?

Yes — the export button downloads exactly what is on screen, current filters included. The reports library goes further, with breakdowns exportable as CSV, Excel, JSON, PDF, Word, Markdown or HTML.

Q What is the Matrix view for?

It is a category × status grid of counts — the whole workspace in one glance. Click any cell and IRIS opens exactly those tickets as a filtered list. It is the fastest way to answer “how many repair tickets are still new?”

Q Can I attach photos to a ticket?

Yes — images (JPEG, PNG, WebP, GIF), PDFs, Word and Excel files, up to 10 MB each. For anything physical — a broken part, a leak, signage — a photo is the single most useful thing you can add.

Q What do the voice features actually do?

The microphone supports dictation (speak, and your words land in the field) and simple commands like “review draft” and “approve ticket”. It depends on your browser's speech support; the mic greys out where unavailable.

Q My “Assigned to me” tab is empty but I have tickets.

That tab shows tickets assigned to your linked staff profile. If your account isn't linked to a staff record yet, the queue reads empty — ask an administrator to link it in People & teams.

Q What does the “escalated” flag mean?

The ticket has been raised for management attention beyond its normal priority. It is a spotlight for genuine risk — safety, repeat failures, an unhappy member about to churn — not a way to jump the queue.

Q Who can see my saved views and board layout?

Only you. Your columns, filters, view choices and saved views are stored with your account in the workspace, so they follow you to any device — but they are yours alone.

Glossary

The words IRIS uses, in plain language.

Ticket	One tracked issue, request or piece of feedback, from filed to closed.
Category / sub-category	What the ticket is about; decides the questions asked and the team that owns it.
Routing	The automatic placement of a ticket with its owning department the moment it is filed.
Routing reason	The plain-words explanation on every ticket of why it went where it went.
Priority	How urgent the ticket is — critical, high, medium or low — with a matching response target.
Response target (SLA)	The first-response commitment attached to each priority, in hours.
Breached	Past the response target without a first response; flagged and surfaced until handled.
Escalated	Flagged for management attention beyond its priority — a spotlight for genuine risk.
Status	Where the ticket is in its life: New → Triaged → Assigned → In progress → ... → Closed.
Record-only / Recorded	A ticket filed for the record — praise, assessments — with no deadline to chase.
Owner / assignee	The one person currently accountable for a ticket, matched by department and studio.
Private resolution	The owner-only write-up of what was actually done; not visible to anyone else.
Ops checklist	The concrete next steps IRIS writes onto a ticket for the owning team.
Member-facing update	Ready-to-send wording on the ticket for replying to the member.
Internal brief	Context on the ticket written for the team, not the member.
Tags	Quick labels applied at filing; filters and reports lean on them.
Linked record	A real member, class or asset attached from live data, instead of a typed name.
Class desk	The “start from a class” intake: pick a session and the ticket builds itself around it.
Matrix view	The category × status grid on All tickets; click a cell to open those tickets.
Feed view	The chronological stream of tickets, newest first.
Saved view	A stored filter combination on All tickets — your queue, one click away, on any device.
Draft	A privately saved, half-finished intake — three slots, visible only to you.
Revision check	The safeguard that stops two people silently overwriting each other's edits.
Audit trail	The permanent record of who changed what on a ticket, and when.
Asset	One item in the equipment register — with status, photos and snag history.
Snag	A fault logged against an asset; the history survives even after retirement.
Momence	The studio platform behind members, sessions, rosters and memberships.
Demo record	A labelled sample shown only when no live connection exists; never mixed with live data.

Need help beyond this guide?

Ask your studio's workspace administrator — they can fix accounts, adjust routing and answer anything this guide doesn't.

IRIS
